

This project really made me run in circles as I felt very limited by my coding skill and eventually made me feel unmotivated to work on a boring idea. At first, I just knew I wanted to make a fidget-like interactive wallpaper as those were something I always enjoyed when live-wallpapers first came out. After further ideating due to disliking the work thus far, I realised it would have been cool and a lot more of my interest to make it exploratory, similar to world building games where cameras were involved, pushing peak interactivity as it gave users autonomy over where they'd want to go, how they'd respond to their surroundings etc. All this felt like something that was intuitive driven, thus I shifted my goal from wanting to create something cool (which in hindsight is a very vague goal) to something intuitive where it would attract people to want to continuously interact and find out more interactions to the artwork.

Going into the process itself, it started off very 2D, with the fish being flat but still animated. Though I already achieved my goal of creating a 3D sphere with noise, texture and striking visuals, the whole project felt very stagnant and less interactive as I'd imagined. It made me reflect on what artworks I found joy in making and the mediums of work I had interest in. Thus I took inspiration from my previous work where I realised it felt lazy to leave the main focus; the fish, 2D while the world; the sphere, was 3D. So I 3D modelled the fish on Womp and from there learnt how to add models into javascript and the layers, materials, and lighting that comes into play.

Overall this project allowed me to grow in my coding and debugging abilities, teaching me how important it is to stay curious and be open to learning at my own pace, whether it be through rewatching the same tutorial video on youtube or dissecting the information google gives me. I learnt to also focus on my interests; in this case 3D modeling, and take advantage of them to further my learning, doing something of the same interest while pushing my knowledge of a new tool to learn more.
